FeelIt · v1 data model

A proposal for the data behind the eight Nov 2026 screens: check-in, "You're not alone", Spread love, What do they say?, Happy ending, My plant, Report and I need help.

Status	Proposal for review
Date	November 2026
Sources	`mocks/nov2026-current`, README, OPEN-QUESTIONS, Nov 2026 deck
Diagram source	`design/data-model.mmd`
Scope	Entities, relationships and v1 rules. API, platform and hosting come in the technical design.

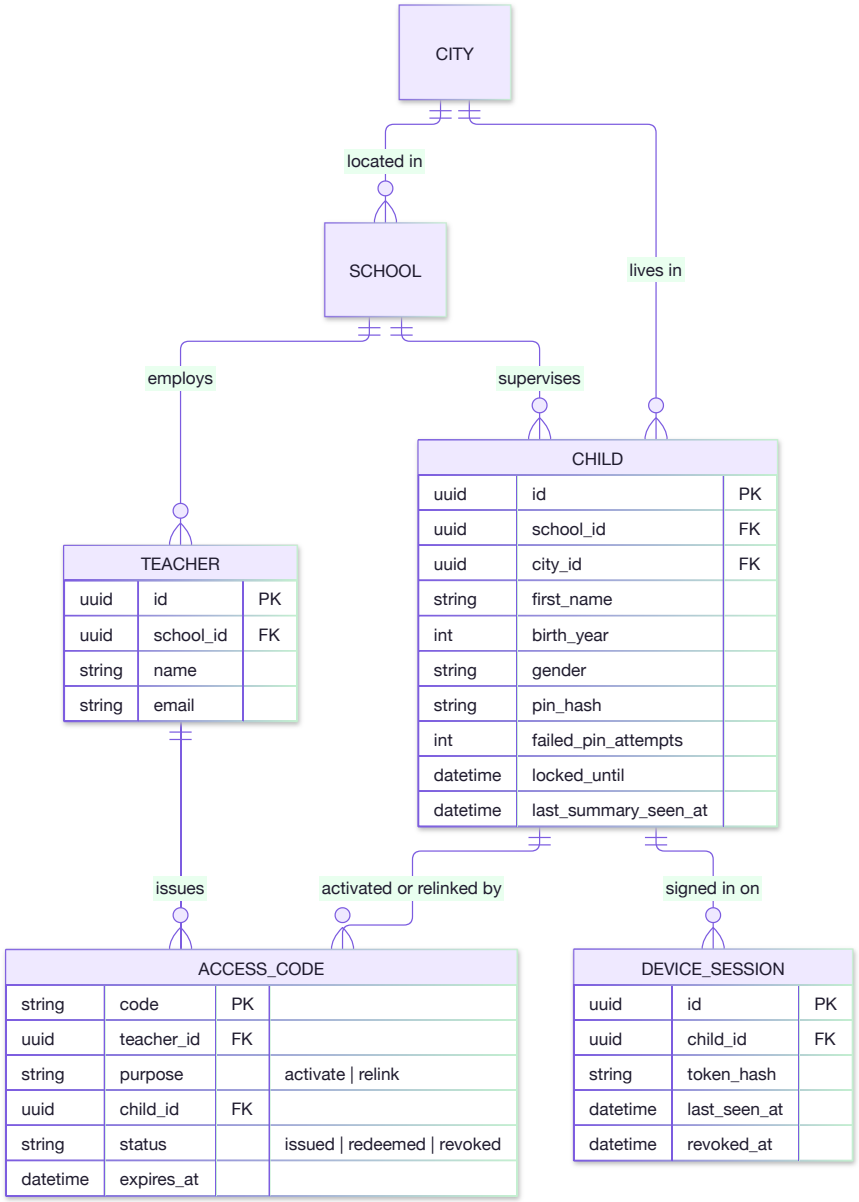

The whole model at a glance

Relationships only

Identity and access

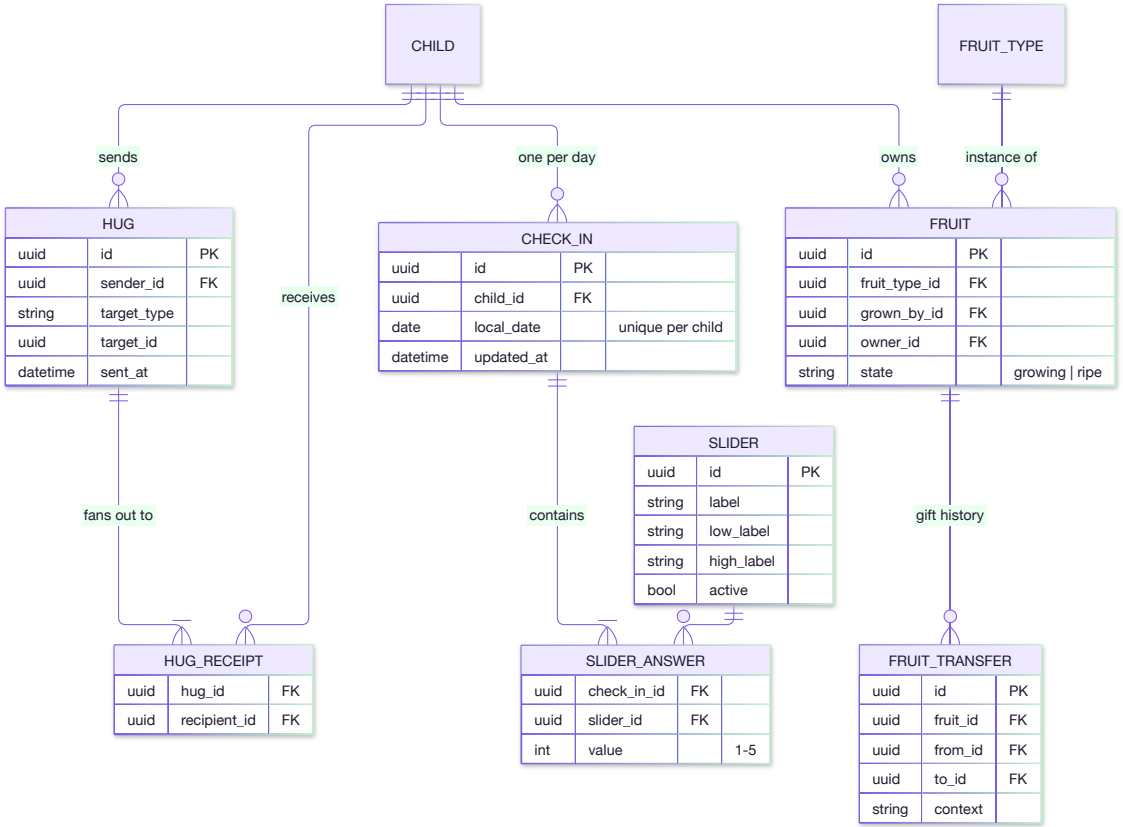

Teacher-issued codes · PIN sign-in · school supervision

How it works

- A teacher hands the child a **one-time code**. Redeeming it creates the child and a session cookie, and the kid picks a **6-digit PIN**.
- **Cleared or new browser:** the kid signs in again with the same code plus the PIN. After 5 wrong tries the account locks.
- **Locked or forgotten PIN:** the teacher asks the NGO for a `relink` code that points to the same child. The plant, fruits and hugs carry over.
- The child row holds only **first name, birth year, gender and city**. The school is stored for supervision but never shown to other kids.
- **Teachers see nothing** about a child beyond their codes. In the schema, `TEACHER` links only to `ACCESS_CODE`.
- **No notifications.** A "while you were away" card lists hugs, gifts and endings received since `last_summary_seen_at`, computed from existing tables.

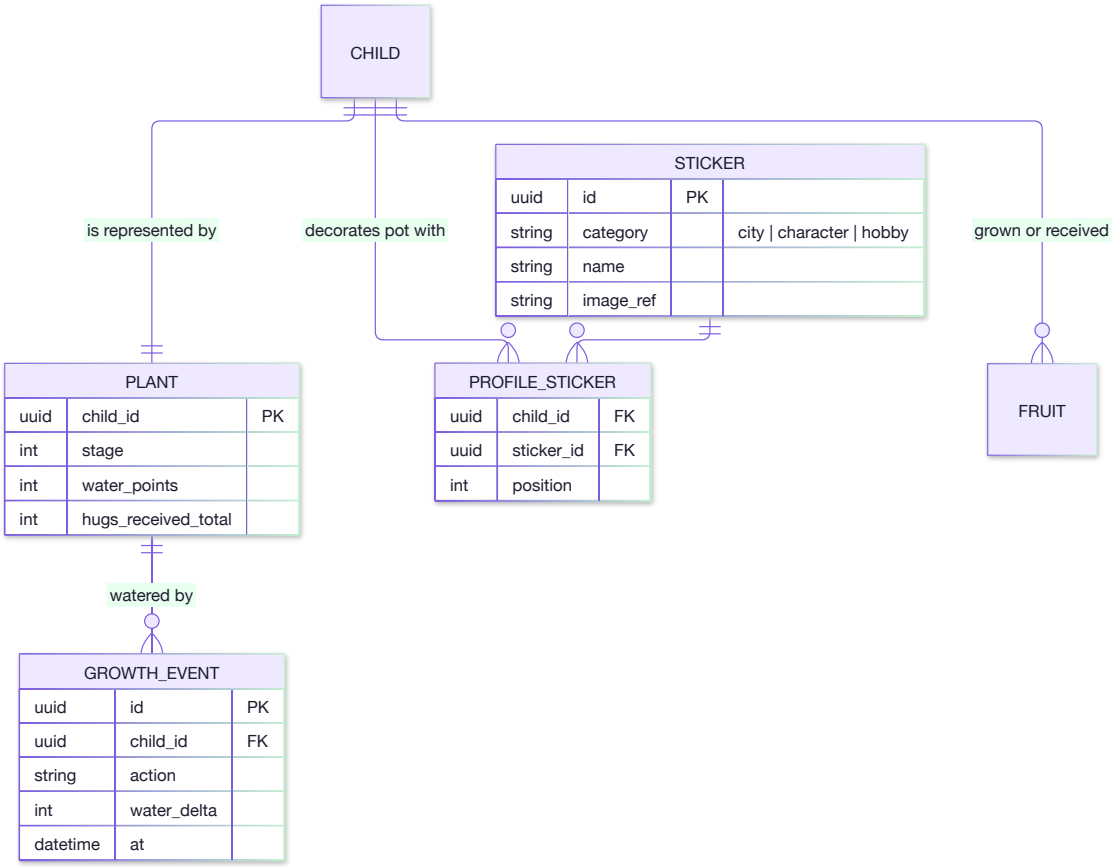

Check-in, hugs and gifts

How it works

- **One check-in per child per day**, editable that day. Kept for a fixed period, then deleted.
- **"Feels similar"** is computed when needed: kids whose recent check-ins have similar slider values, each counted once. The window, threshold and minimum group size are settings.
- **Hugs are unlimited** (rate-limited only). A group hug saves who received it at send time, one receipt per kid. Receipts drive the hugs-received total and the notifications.
- **Fruits are the gift icons.** Each fruit is a single item with one owner. Giving it away moves ownership, and the giver no longer has it.
- **"Gift to someone"** picks one random kid from the similar group. The recipient never learns who sent it.

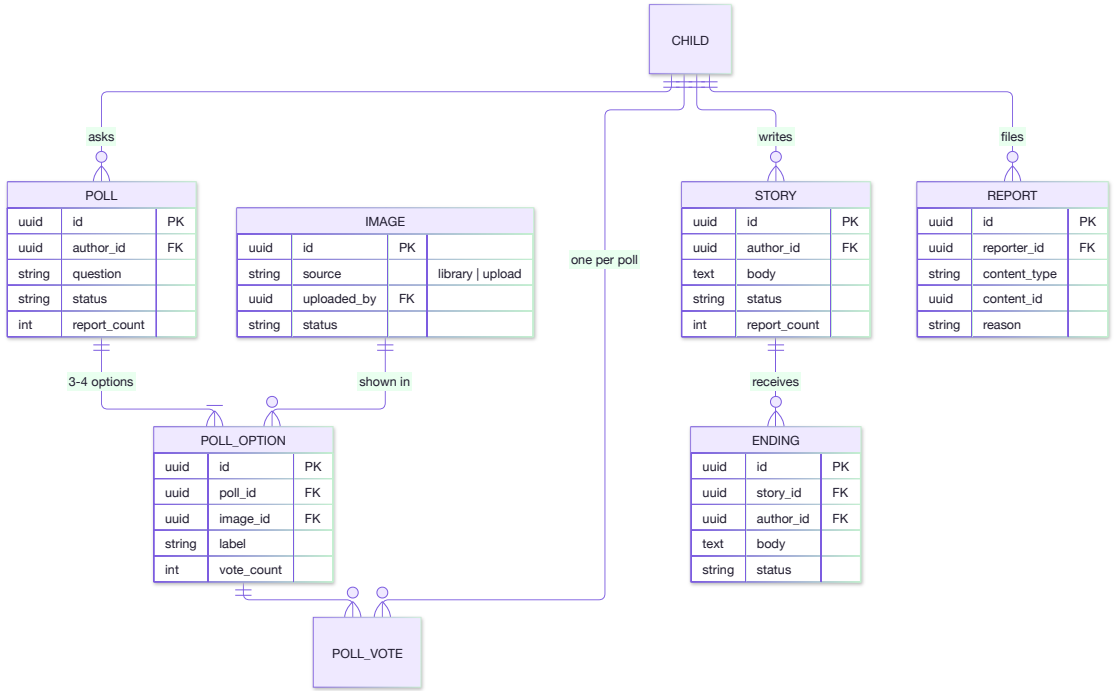

My plant and profile

How it works

- **Growth is a log of events.** Every check-in, vote, hug or ending adds water. Stage and water points are totals of that log, so the rules can change without migrating data.
- The plant **never shrinks** when old check-ins are deleted, because growth is stored separately.
- **Hugs received** is one cached total, shown on My plant and on Spread love.
- **Stickers** come from a catalog (city, character, hobby). Every profile has at least the city sticker.
- **My fruits:** "grown" fruits are where `grown_by` is me; "received" fruits are owned by me but grown by someone else.
- The child's **own stories** appear here, looked up by author.

Polls, stories and reports

How it works

- **Authors are anonymous.** Author IDs stay on the server; the app never shows who wrote, voted, sent or reported.
- **Poll images** come from a library or a kid's upload. Both live in `IMAGE`. Results are shown to a child after they vote.
- **Automatic safety check, no human review in v1.** New content starts as `checking`, then becomes `published`, or `hidden` with `hidden_reason = safety_check`. Human review can be added later on the same statuses.
- **Reports:** one per kid per item, with one of four fixed reasons. After N reports the item is hidden for everyone. Stored reports become the review queue later.
- The **help screen** uses a `HELP_LINE` table (region, need, organization, number, date checked). Taps are not reported anywhere.

Decisions taken in review

Nov 2026

Topic	Decision	Effect on the model
Sending hugs	Unlimited, with a rate limit only	No hug balance or ledger; rate limit checked against `HUG`
Hug counter	The chip shows total hugs received	One cached total on `PLANT`
Gift icons	Same thing as fruits	One `FRUIT_TYPE` catalog
Fruit uniqueness	One owner; giving moves it	`FRUIT.owner_id` plus a `FRUIT_TRANSFER` history
Sign-in	One-time code from the teacher; the school supervises	`SCHOOL`, `TEACHER`, `ACCESS_CODE`, `DEVICE_SESSION`
Signing in again	The same code plus a 6-digit PIN; locks after 5 wrong tries	`pin_hash`, `failed_pin_attempts`, `locked_until` on `CHILD`
Locked or new device	Teacher gets a relink code from the NGO	`ACCESS_CODE.purpose = relink`; the same child is kept
Teacher visibility	None beyond managing codes	No link from teachers to child activity
Check-in	Once a day, editable	Unique (child, date)
"Feels similar"	Similar slider values over recent days	Computed when needed; window is a setting
Review	Automatic safety check on text and images; human review later	`status`: checking, published, hidden; plus `hidden_reason`
Reports	Hide for everyone after N reports	`report_count` plus a threshold setting
Poll images	Library and uploads; uploads live immediately	`IMAGE.source`
Stories	In the feed anonymously and on the author's plant	Looked up by author
Poll results	Visible after voting	Cached `vote_count` per option
Check-in retention	A fixed period	Daily purge; growth stored separately
Notifications	None; a "while you were away" card instead	`CHILD.last_summary_seen_at`; no notification table

Settings, risk and what's still open

For discussion

Tunable settings (`APP_SETTING`)

similar_window_days	How many recent days count for "feels similar"
similarity_threshold	How close slider values must be
min_group_size	Hide the count below this, for privacy
auto_hide_report_threshold	Reports before an item is hidden
checkin_retention_days	How long check-ins are kept (must be longer than the similarity window)
hug_rate_limit	Anti-spam limit on sending hugs
pin_max_attempts	Wrong PINs before the account locks (5)

Still open (no schema change needed): which actions water the plant and by how much, number of growth stages, when a fruit ripens, the sticker and fruit catalogs, and notification wording.

Remaining risk

- Kids' uploads and free text are now **checked automatically before publishing**, but there is **no human review** in v1.
- An automatic check will miss some harmful content, especially in Hebrew. Anything it misses stays visible until enough kids report it.
- Ways to reduce it further:
  - Test the text check on real Hebrew examples before the pilot.
  - A low report threshold for uploads (for example, 1).
  - A daily look at hidden items by NGO staff, as a first step toward review.
- The Nov 2026 deck proposed human review before publishing free text.
